CLAIMS

- Electric machine with a squirrel-cage rotor, characterized in that the squirrelcage rotor has a cage winding made of flexible conductors (L1, L2).
- 2. Electric machine according to claim 1, characterized in that the flexible conductors (L1, L2) are stranded wires.
- 3. Electric machine according to claim 1 or 2, characterized in that the stranded wires are arranged in a meander pattern, running in opposite directions in the slots (n, n+1, n+2) of the squirrel-cage rotor, so as to establish the cage connection already in the rotor.
- 4. Electric machine according to claim 1, 2 or 3, characterized in that the stranded wires are electrically contacted at least inside a slot (n, n+1, n+2).
